Cable management is essential.

Cable management is often an overlooked but critical element in office design. No matter how beautiful the furniture, fabrics and details are, once people start working in the office environment and using hardware, like computers, monitors and laptops, it often compromises the intended design. Cable management solutions are either not installed, installed too late or by end users, which comes at the expense of the quality of the chosen products and subsequently increases the installation costs. A missed opportunity, but we understand why...

Choose a colour, any colour...

In addition to black, white, and grey, our new series of cable management products is available to order in practically any RAL colour, from moss green to Dataflex blue. A small detail can make a huge difference. Furthermore, we will be adding our inspiring limited-edition colours to our range, so keep a close eye on our website and social media.

Designed and produced in the Netherlands

We wanted our new cable guides to be unique, thoughtful, high quality and as sustainable as possible. To meet these requirements, we chose to manufacture them locally. This gave us control and flexibility from the first sketches to the final product. The result is a robust and attractive cable guide with an incredibly low ecological footprint. It can also be manufactured in small batches to meet your specific needs.

The most environmentally friendly cable guide

The new series of cable management products is made from 100% recycled PP. Polypropylene is well known for its excellent recyclability. It is a material that is both strong and flexible. It is easy to add individual elements or to remove elements from the cable guide. This makes the product very adaptable. Due to its stability and flexibility, the cable guide has a long product life. Each cable guide sold saves space in a landfill site.

As long (or short) as you like

The cable guides come in two standard lengths for regular workstations and sit/stand workstations. Additionally, the individual elements can be easily connected and adjusted to any desired length; therefore, also from the ceiling to the floor.
